The complete test summary, for all leads, is developed by compositing together each individual alternan estimate as shown in FIG. 15. This is the most important summary graph that forms the basis for clinical analysis. It has been designed to clearly show the onset and amplitude of any statistically significant alternan signal and highlight alternan disassociation observed across the lead set, which should be visible as both changes in shape from lead to lead and changes in color (amplitude). Key elements of the display are:" and insert the same on Col. 18, Line 26, after "signal.", as a continuation of the same paragraph.
